

Flow path integrity testing

Accurate, reliable data-driven results.

Sold and distributed by:

MGNNewell

Does not require disconnection

Fully automated

No cross contamination

Maximises flexibility

Real-time data available

Quick, efficient flow path integrity testing

ExiFlo® is an innovative hardware device which monitors and tests the integrity of any closed liquid or gas system in service within heat exchange systems. ExiFlo® is able to identify leaks across the boundaries and into the outside environment without the need to take the system off-line. Furthermore, these tests are quickly carried out before and after each production cycle, to ensure that each product batch receives a pass or fail certification before leaving for distribution.

ExiFlo® minimises risk of contamination from cross-channel flow, which can lead to loss of production, reduction in efficiency and product recalls that are highly damaging to brand reputation. In this manner, ExiFlo® maximises your brand's compliance.

Major Impact:

- Does not require disconnection and invasive inspection
- Able to be installed to existing lines with different types of heat exchangers or tanks
- Utilises process water, resulting in no contamination or post-test cleaning
- Qualification of leaks

Medium Impact:

- On demand testing carried out on an automated or manual process at start of each shift or batch
- Tests are carried out in-situ and under operational conditions without requiring a high-pressure differential
- Data available in real time remotely or at the module
- Automated operation with no advanced training required

Additional Impact:

- Significantly shorter and reliable testing eliminating downtime
- Mitigates false readings due to liquid test media
- More accurate pressure testing tolerance

Patent Granted : GB 2622765 B
